

Network Setup Example

Taken from CS 231 Lab

Connection

1. Fiber and Copper comes in from the ISP
2. Fiber and Copper connect to the Router
3. Router connects to the switch
4. The Switch connects to the Panels and to the Servers
5. The Panels connect out to the building (departments, floors, etc.) there can be other switches that these panels connect to which then connect to individual workstations etc.
6. The UPS (back up power) connects to servers (varies per company)
7. The Wireless Controller connects to the router or switch (couldn't find exact information on this online)

From top to bottom of the closet rack:

- Router
- Switch
- Patch Panel
- Patch Panel
- CorpServer
- CorpiSCSI
- UPS
- Wireless Controller

1. Pro Series Router

Information: Ethernet, 4 SFP ports, 2 RJ45 ports

Front

Back

2. Cisco Switch

Information: Ethernet, 28 RJ45 ports, 2 SFP ports, PoE

Front

Back

3. Patch Panel

Information: RJ45, 24 Ports

Front

Back

4. Patch Panel

Information: Fiber, 24 ports

Front

Back

5. CorpServer

Information: None given

Motherboard

Front

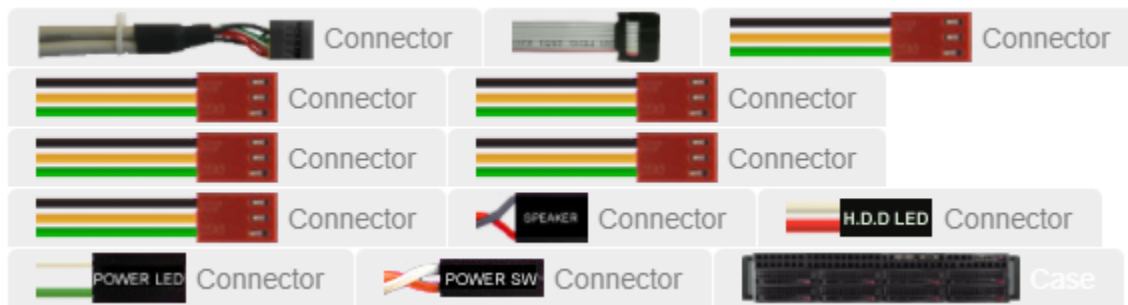

Back

CorpServer Monitor

6. CorpiSCSI

Motherboard

Front

Back

CorpiSCSI Monitor

7. UPS

Information: Rack mount, 8 outlets, AC, 120 volts, USB port
Battery backup
Unattended power supply

Front

Back

8. Ruckus Wireless Controller

Information: rack-mounted.

Front

Back

A wireless LAN controller, or WLAN controller, monitors and manages wireless access points in bulk and allows wireless devices to connect to WLAN, a wireless network architecture. As a centralized device in the network, the wireless LAN controller is usually located at the data center, to which all the wireless APs on the network are directly or indirectly connected.
